▸ El evento dynamiccomponents define la estructura html para los diferentes estados del componente

```
dynamicComponents () {
    let input, actionButton;
    const {editMode, todo} = this.state;

    if(editMode) {
        input = (
            <input
                type="text"
                className="form-control"
                value={todo}
                onChange={(e) => this.handleChange(e)}
            />
        );
        actionButton = (
            <button
                type="button"
                className="btn btn-warning text-white"
                onClick={this.onEditMode.bind(this)}
            >
                Actualizar
            </button>
        );
    } else {
        input = todo;
        actionButton = (
            <button
                type="button"
                className="btn btn-warning text-white"
                onClick={this.onEditMode.bind(this)}
            >
                Editar
            </button>
        );
    }
    return {input, actionButton};
}
```

```jsx
dynamicComponents () { ⬛
    let input, actionButton;
    const {editMode, todo} = this.state;

    if(editMode) {
        input = (
            <input
                type="text"
                className="form-control"
                value={todo}
                onChange={(e) => this.handleChange(e
            />
        );
        actionButton = (
            <button
                type="button"
                className="btn btn-warning text-whit
                onClick={this.onEditMode.bind(this)}
            >
                Actualizar
            </button>
        );
                                                            ',
                                                    } else {
                                                        input = todo;
                                                        actionButton = (
                                                            <button
                                                                type="button"
                                                                className="btn btn-warning text-white"
                                                                onClick={this.onEditMode.bind(this)}
                                                            >
                                                                Editar
                                                            </button>
                                                        );
                                                    }
                                                    return {input, actionButton};
}
```
